

The image shows an industrial facility, likely a chemical plant or refinery. In the foreground, there are several large, cylindrical storage tanks with a light blue or grey corrugated metal surface and a prominent green horizontal band. To the right, a multi-story industrial building with a grey and white facade is visible. A tall smokestack or chimney rises from the building, emitting a thick plume of white steam or smoke that drifts into the sky. The sky is overcast with grey clouds. In the lower right, a traffic light and a road barrier are visible, suggesting the plant is near a public road.

# **Bleaching Chemicals and Their Properties**

# Bleaching Chemicals

<b>Name</b>	<b>Formula</b>	<b>Symbol</b>
Chlorine	$\text{Cl}_2$	C
Chlorine Dioxide	$\text{ClO}_2$	D
Oxygen	$\text{O}_2$	O
Hydrogen Peroxide	$\text{H}_2\text{O}_2$	P
Sodium Hypochlorite	$\text{NaOCl}$	H
Hypochlorous Acid	$\text{HOCl}$	M
Ozone	$\text{O}_3$	Z
Sodium Hydroxide	$\text{NaOH}$	E

# Bleaching Chemical Properties

- ◆ Equivalent Weight
- ◆ Efficiency
- ◆ Reactivity
- ◆ Selectivity
- ◆ Particle Bleaching Ability
- ◆ Environmental Implications

# Equivalent Weight

- ◆ Bleaching is an oxidation process
- ◆ Bleaching chemicals are oxidizing agents
- ◆ One equivalent weight of a bleaching chemical is the weight of that chemical that is required to do a specified amount of oxidation.
- ◆ Equivalent weight is therefore an inverse measure of oxidizing power

# Equivalent Chlorine

- ◆ Equivalent chlorine is another way of expressing a bleaching chemical's oxidizing power
- ◆ It is defined as the number of pounds (or kg) of chlorine that has the same oxidizing power as one pound (or kg) of the bleaching agent in question
- ◆ Equivalent chlorine is therefore a direct measure of oxidizing power

# Bleaching Efficiency

- ◆ Some of the oxidizing power of a bleaching agent is always wasted in side reactions
- ◆ Some bleaching agents are more prone than others to undergo wasteful reactions; conversely, some use their oxidizing power more efficiently than others
- ◆ Efficiency is a measure of the degree to which a bleaching agent's oxidizing power is used in desirable, lignin-degrading reactions

# Equivalent Wt. and Efficiency

<b>Chemical</b>	<b>Equiv. Weight</b>	<b>Equiv. Chlorine</b>	<b>Efficiency</b>
Cl <sub>2</sub>	35.5	1.00	H
ClO <sub>2</sub>	13.5	2.63	H
O <sub>2</sub>	8	4.44	L
H <sub>2</sub> O <sub>2</sub>	17	2.09	L
NaOCl	37.2	0.93	M
O <sub>3</sub>	8	4.44	H

**L=Low M=Med. H=High**

# Equivalent Chlorine Charge

- ◆ The charge of chlorine or chlorine dioxide in the first bleaching stage that employs either is often expressed as **kappa factor**, sometimes also called **active chlorine multiple**

$$\textit{Kappa Factor} = \frac{\textit{Percent Eq. Cl}_2}{\textit{Kappa No.}}$$

# Reactivity and Selectivity

- ◆ Reactivity may be defined in terms of the fraction of the residual lignin that the bleaching agent is practically capable of removing
- ◆ Selectivity is the degree to which the bleaching agent can remove lignin without dissolving or damaging the other components of the fiber, cellulose and hemicellulose

# Reactivity and Selectivity

Chemical	Reactivity	Selectivity
Cl <sub>2</sub>	H	H
ClO <sub>2</sub>	M	H
O <sub>2</sub>	L	M
H <sub>2</sub> O <sub>2</sub>	L	M-H
NaOCl	M	M
O <sub>3</sub>	H	M

**L=Low M=Med. H=High**

# Particle-Dirt Removing Ability and Environmental Implications

- ◆ Different bleaching agents differ in their ability to remove dirt particles, a very important characteristic
- ◆ For good dirt removal, chemical reaction with lignin must be slow enough to allow time for diffusion of chemical into particles
- ◆ Different bleaching agents engender different levels of concern for the environment; whether the concern is justified may be irrelevant

# Dirt and Environmental

<b>Chemical</b>	<b>Dirt Removal</b>	<b>Environmental Implications</b>
Cl <sub>2</sub>	H	H
ClO <sub>2</sub>	H	M
O <sub>2</sub>	M	L
H <sub>2</sub> O <sub>2</sub>	L	L
NaOCl	H	H
O <sub>3</sub>	L	L

**L=Low M=Med. H=High**
